Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the

application. The following listing provides the amended claims with the amendments marked

with deleted material crossed out and new material underlined to show the changes made.

Listing of Claims:

Claims 1-26. Canceled.

27. (Currently Amended) A method of pre-computing routes for nets in a region of an

integrated circuit ("IC") layout, the method comprising:

a) <u>prior to performing a routing operation</u>, defining a set of partitioning lines

for partitioning the region, during the routing operation, a region of an integrated circuit ("IC")

layout into a plurality of sub-regions during a routing operation;

b) for a set of potential sub-regions, identifying a set of at least two routes

that traverse the potential set of sub-regions, wherein at least one of the routes has at least one

diagonal edge; and

storing the identified routes, wherein said stored routes are for use during

the routing operation.

c)

28. (Previously Presented) The method of claim 27, wherein a plurality of paths exist

between the sub-regions defined by the set of partitioning lines, wherein a plurality of the paths

are diagonal paths, wherein at least one of the routes traverses some of the diagonal paths.

Attny Docket: SPLX.P0044 Client Ref: 2002-082 C 07

Client Ref: 2002-082 C 0

-- 2 --

29. (Previously Presented) The method of claim 28 wherein identifying the routes

comprises identifying the paths between the sub-regions used by each route.

30. (Previously Presented) The method of claim 29, wherein a plurality of the paths

are Manhattan paths, wherein at least one of the routes traverses some of the Manhattan paths.

31. (Previously Presented) The method of claim 27, wherein a plurality of edges exist

between the sub-regions defined by the set of partitioning lines, wherein a plurality of the edges

between the sub-regions are diagonal edges, wherein at least one of the routes intersects at least

one of the diagonal edges.

32. (Previously Presented) The method of claim 31, wherein identifying the routes

comprises identifying the edges between the sub-regions intersected by each route.

33. (Previously Presented) The method of claim 32, wherein a plurality of the edges

between the sub-regions are Manhattan edges, wherein at least one of the routes intersects at

least one of the Manhattan edges.

34. (Previously Presented) The method of claim 33 further comprising:

-- 3 --

a) for each particular set of potential sub-regions from a group of potential-

sub-region sets, identifying a set of routes that traverse the particular set of potential sub-regions,

wherein some of the routes have diagonal edges; and

b) storing the identified routes.

Attny Docket: SPLX.P0044 Client Ref: 2002-082 C 07

35. (Previously Presented) The method of claim 34, wherein the group of sets

includes all possible sets of sub-regions including sets with zero or one sub-region, wherein the

identified sets of routes for sets of sub-regions with zero or one sub-region are empty.

36. (Previously Presented) The method of claim 34, wherein the group of sets

includes all combinations of two or more sub-regions.

37. (Currently Amended) For a router that uses a set of partitioning lines to partition

an integrated-circuit ("IC") layout region into a plurality of sub-regions, wherein a plurality of

routing paths exist between the sub-regions, a method of pre-computing routes for connecting

said sub-regions, the method comprising:

for each particular combination of two or more sub-regions, identifying at least

one route for connecting the particular combination of said sub-regions, said identifying

performed before a routing operation;

identifying the routing paths used by each identified route, wherein some of the

identified routing paths are diagonal; and

storing the identified routing paths for each identified route in a storage structure,

wherein said stored routing paths are for use during the routing operation.

38. (Previously Presented) The method of claim 37, wherein some of the routing

paths are horizontal.

Attny Docket: SPLX.P0044 Client Ref: 2002-082 C 07

Client Ref: 2002-082 C 07 PTO Serial Number: 10/041,957 39. (Previously Presented) The method of claim 37, wherein some of the routing

paths are Manhattan.

40. (Previously Presented) The method of claim 39, wherein the Manhattan routing

paths are defined with respect to a first grid, and wherein the diagonal routing paths are defined

with respect to a second grid.

41. (Previously Presented) The method of claim 37, wherein the set of partitioning

lines includes intersecting lines that form a partitioning grid.

42. (Currently Amended) For a router that uses a set of partitioning lines, that define

a plurality of slots, to partition an integrated-circuit ("IC") layout region into a plurality of sub-

regions corresponding to said slots, wherein a plurality of edges exist between said slotssub-

regions, a method of pre-computing routes for connecting said sub-regions, the method

comprising:

for each particular combination of at least two of said slotssub-regions,

identifying at least one routing graph for connecting the particular combination of

said slotssub-regions, wherein said identifying is performed before a routing operation;

identifying the edges intersected by each routing graph identified for the particular

combination of said slotssub-regions,

wherein some of the identified edges are diagonal; and

Attny Docket: SPLX.P0044 Client Ref: 2002-082 C 07

storing the identified edges for each routing graph identified for the particular combination

of said slotssub-regions in a storage structure, wherein said stored edges are for use during the

routing operation.

43. (Previously Presented) The method of claim 42, wherein some of the edges are

horizontal.

44. (Previously Presented) The method of claim 42, wherein some of the edges are

Manhattan.

45. (Previously Presented) The method of claim 44, wherein the Manhattan edges are

defined with respect to a first grid, and wherein the diagonal edges are defined with respect to a

second grid.

46. (Currently Amended) A method of pre-computing routes for nets in a region of an

integrated circuit ("IC") layout, the method comprising:

a) <u>prior to performing a routing operation</u>, defining a set of partitioning lines

for partitioning the region, during the routing operation, a region of an integrated circuit ("IC")

layout into a plurality of sub-regions-during a routing operation, wherein a plurality of ±45°

diagonal edges and a plurality of Manhattan edges exist between the sub-regions;

b) for a set of potential sub-regions, identifying a set of <u>at least two</u> routes

that traverse the potential set of sub-regions, wherein at least one of the routes utilizes at least

one diagonal edge and one Manhattan edge; and

-- 6 --

Attny Docket: SPLX.P0044 Client Ref: 2002-082 C 07

c) storing the identified routes, wherein said stored routes are for use during

the routing operation.

47. (Currently Amended) A method of pre-computing routes for nets in a region of an

integrated circuit ("IC") layout, the method comprising:

a) defining a set of partitioning lines for partitioning the region, during the

routing operation, a region of an integrated circuit ("IC") layout into a plurality of sub-regions,

said defining performed before the routing operation, wherein a plurality of ±45° diagonal paths

and a plurality of Manhattan paths exist between the sub-regions;

b) for a set of potential sub-regions, identifying a set of at least two routes

that traverse the potential set of sub-regions, wherein at least one of the routes utilizes at least

one diagonal path and one Manhattan path; and

storing the identified routes, wherein said stored routes are for use during

the routing operation.

c)
